
Priority queue over T*
Entity types ranked by Weeds-precision
pop highest-priority type t*
Compare vs. candidates at current level
synonym of t*→ merge
e.g. t* movie vs film→ merge movie into film
no synonym match for t*
parent of t* → descend into its children
recurse: compare t* to the nodes one level deeper; if depth exeeds D max → place at the current level
e.g. t* documentary film vs audiovisual work → descend
no parent match for t*
child of t*→ reparent above t*
corrects an earlier too-shallow attachment
e.g. film subsumes documentary film → reparent documentary film
no child match for t*
no match in parent or child check for t*
settle: new root (top level) or child on the current level
e.g. war film vs documentary film → settles as sibling
t* placed in the H*
consolidate
if there are > B nodes on the current level → groups siblings under a new parent
e.g. war film + action film → genre film
repeat until the priority queue is empty
